

4-Function Wireless Control With Latching Option

• This receiver is a 340 MHz, 4 function control. The receiver can be configured for either momentary or latching operation. The unit operates on 12 VDC and provides 4 independent contact closure outputs. All of the electronic components are encapsulated so the receiver is capable of being operated in harsh environments. • Turning any of the 4 DIP switches to the 'On' position enables the corresponding latching function. Pressing the transmitter button once will energize the relay output. Pressing the same button a second time will de-energize the relay output. If the DIP switches are in the 'Off' position, the corresponding relay will have a momentary function. In this mode, the relays are energized for as long as the transmitter button is depressed. Momentary and latching functions can be intermixed as desired. • 12 VDC Operation • 10 Amps Per Output • Program up to 4 transmitters per receiver. • 4' Long Range Antenna

Programming Instructions

- Connect Power to the Receiver
- Press the Blue Button on Receiver
- LED Should Illuminate
- Immediately Press Any Transmitter Button
- Receiver LED Will Blink Off Then On
- After 5 Seconds the LED Will Turn Off
- The Receiver is Now Programmed
